I. Background

1. This document was produced in response to recommendation III, Article IV, of the III Meeting of the Scientific and Technical Advisory Committee (STAC) to the Protocol Concerning Specially Protected Areas and Wildlife (SPAW) in the Wider Caribbean Region, held in Caracas, Venezuela, 4-8 October 2005.

   “…a. The SPAW/RAC in collaboration with Governments and relevant organizations compile and make available the following:
   iv. Protocols and techniques for responding to strandings;
   …noting that this process is ever-evolving.”

3. It is clear that in the Wider Caribbean Region, there is a pressing need for capacity building in the area of response programmes to strandings. The first Eastern Caribbean Marine Mammal Stranding Response Training Workshop (MMSW) was held at the University of West Indies Veterinary School of Medicine at the Eric Williams Medical Sciences Complex, Champs Fleurs, Trinidad from November 15 to 18, 2005. The purpose of the workshop was to provide stranding response and necropsy training—a core of marine mammal stranding expertise and tools—in the Eastern Caribbean region.

4. Seeking to take advantage of the accumulated expertise of colleagues, the University of the West Indies (UWI) School of Veterinary Medicine collaborated with the U.S. National Marine Fisheries Service (NMFS), UNEP/Caribbean Environment Programme (CEP), the Eastern Caribbean Cetacean Network (ECCN), MARVET (Grenada), and the Smithsonian Marine Mammal Laboratory (Washington, D.C) to convene the workshop. The recommendations contained in the Final Report of the Workshop are transcribed in Annex I.

5. The present document is organized in two parts: (1) general summary of issues, procedures and considerations pertaining to strandings, with excerpts and text taken from key literature (listed in Section III) and (2) compilation of protocols and techniques for responding to strandings, based on better known examples, particularly from the USA, as well as outlining relevant sources of information and organizations, from within and outside the Wider Caribbean Region. This document is not a comprehensive review nor should it be considered as Guidelines. Its goal is to provide an overview of protocols and practices for responding to strandings.

6. Submissions of errors, omissions and new publications for inclusion can kindly be made directly to SPAW/RAC.
II. General summary of issues and procedures

1. Definitions and Decisions on When to Intervene

**Stranding**: occurrence of a marine mammal (either dead, ill or alive) immobilised ashore.

**Mass Stranding**: stranding of two (except mother with calf) or more animals near in time and space.

**Mass die-off**: mortality on a large scale (without inference on the cause of death or species involved).

The U.S. Working Group on Marine Mammal Unusual Mortality Events has developed a set of criteria to determine the occurrence of an unusual mortality event. The criteria are:

1. A marked increase in the magnitude or a marked change in the nature of morbidity, mortality or strandings when compared with prior records.
2. A temporal change in morbidity, mortality or strandings is occurring.
3. A spatial change in morbidity, mortality or strandings is occurring.
4. The species, age, or sex composition of the affected animals is different than that of animals that are normally affected.
5. Affected animals exhibit similar or unusual pathologic findings, behavior patterns, clinical signs, or general physical condition (e.g., blubber thickness).
6. Potentially significant morbidity, mortality or stranding is observed in species, stocks or populations that are particularly vulnerable (e.g., listed as depleted, threatened or endangered or declining). For example, stranding of three or four right whales may be cause for great concern whereas stranding of a similar number of fin whales may not.
7. Morbidity is observed concurrent with or as part of an unexplained continual decline of a marine mammal population, stock, or species.

**Stranding Network**: human and institutional coordination for the monitoring of cetacean strandings. Its objective include:

- Provide welfare of live stranded animals
- Allow the wider community to report strandings in an efficient and rapid way
- Minimize risk to public health and safety
- Support scientific research and assist in determining causes of mortality
- Advance awareness and education on marine mammals

**When to Intervene**:

Not every animal on the beach needs help. Recognizing normal animal behaviours, especially from coastal species will avoid unnecessary action. Deciding what course to take requires an understanding of the animal’s natural history, social organization, and species specific considerations, and should bear in mind that a rescue effort generates interest from the public.

Criteria for deciding when to intervene include consideration of the following questions:

- How many animals are involved? Attempting to give equal attention to more animals than resources allow may compromise adequate care for any one.
- Is logistical support available?
• Are local weather and sea conditions favorable?
• Can animal condition be accessed?
• What is the time elapsed since stranding?
• Can it be easily handled?
• Are care facilities available?

2. The Response Team

Institutional mandate

A stranding network must function within the legal framework established by various relevant authorities and organizations at local, national and regional levels to ensure effective coordination, avoid duplication of efforts and actions, and achieve action its long-term goals.

Efforts in the Wider Caribbean

National stranding networks require consideration of their own particular institutional capacities, mandates and resources both human and logistical.

A Caribbean Stranding Network (CSN- http://rov.caribe.net/) has been established in Puerto Rico for almost a decade, which includes the U. S. Virgin Islands, the British Virgin Islands, the Dominican Republic, Venezuela, and Colombia. The CSN reports cases of stranded marine mammals, sea turtles, and sea birds. In addition, the CSN also attempts to rescue and rehabilitate sick or injured animals.

The Eastern Caribbean Cetacean Network (ECCN- www.eccnwhale.org) is a regional, volunteer network that records sightings and strandings of marine mammals in the Eastern Caribbean. It operates out of Bequia, St. Vincent and the Grenadines, and of the Woods Hole Oceanographic Institute, Massachusetts USA, being directed by Dr. Nathalie Ward.

Stranding network efforts are also under way in Turks & Caicos and more recently in Trinidad and Tobago.

Elements of an ideal network include:

• A mechanism for allowing quick reporting of live stranded, ill, injured or dead animals (a "24 hours" hotline telephone service)
• An emergency response team, with a veterinary component to attend the reports of strandings, particularly live animals.

Responsibilities

The composition of a response team depends on the type and frequency of animals coming ashore. Common to all situations, however, is the basic need for the team to:

- respond rapidly
- contact local authorities upon arrival
- evaluate the situation
- provide emergency care
- arrange to take action (release, transport, necropsy, specimen and data collection, and photographic documentation)
- enlist local assistance
- provide information to the public and media
- protect public health and ensure safety
To maintain communications with stakeholders:

- Organised and standardised data collection and reporting procedures
- Logistic support and equipment for retrieval and transport of animals (when required)
- A facility for medical treatment and rehabilitation in the case of live animals
- A facility for the effective necropsy of dead animals by trained personnel

To be of real value, data have to be collected in a consistent manner, from the largest possible number of animals and over a long time period.

NGO’s can play an important role in stranding networks by mobilising volunteers to cover as much of the national coastline as possible, increasing public awareness on cetacean conservation, and seeking the co-operation of local fishermen.

3. Rescue and Release

Immediate release, returning the animal to sea would require consideration of the following:

- The animal is manageable and logistic support adequate
- Beach and environmental conditions are favorable
- The animal is healthy and able to function normally
- Maternal care for young can be met
- The area of release is within natural or suitable habitat

Logistical capabilities and support are determining to decide whether or not to release an animal.

Rehabilitation

Rehabilitation would require consideration of the following:

- There is a good chance the animal can be restored to health
- Facilities are available and equipped for the species and number of animals involved
- Arrangements can be be made for safe and expeditious transport
- The animal is manageable and poses no major risk to others or to facility staff
- There are sufficient funds and staff to provide care for a reasonable period

The purpose of rehabilitation would be to provide humane care for stranded marine mammals and to optimize the success of releasing into the wild. Care facilities should meet design and operational criteria so as to optimize rehabilitation success rate. A detailed evaluation process is required to determine if, following rehabilitation, an animal is suitable for release.

General Procedures, Data and Sample Collection

The summary information below on General Procedures, Basic Information, and Collection and Storage of Samples for Life History and Health Studies was primarily taken from the Guidelines for the Development of National Networks of Cetacean Strandings Monitoring prepared by the UNEP-Mediterranean Action Plan through its Regional Activity Centre for Specially Protected Areas (RAC/SPA).
General Procedures

Stranding responses will differ according to each case and characteristics of a region and country. Mass strandings will also need additional human resources, although not necessarily skilled or trained at the same level of expertise. Tasks and actions should be cleared, defined, communicated, and supervised, and can generally be summarised as follows:

- To have all the equipment ready for use before a stranding occurs.
- To react quickly. It is important to respond to those notifying a stranding and to inform persons at the stranding site that operations are already under way.
- To evaluate the situation. Once on the beach, it is necessary to obtain all possible information about the stranding and surrounding conditions to take appropriate decisions.
- To contact the relevant authorities. It is important to consider the local, regional or national organisations involved and that can assist to both control the public and the animal.
- To coordinate the action of authorities and volunteers. Those involved either officially or as volunteers require the assistance of a person experienced in strandings. Experts must give them instructions and remember to eventually acknowledge the help received.
- To care for public health and safety. Potential public health problems and distress to the animal, persons involved and the public in general, as well as eventual risks to the security of people or animals should be considered.
- To provide information to the public and the media. This information must be clear and appropriate explaining the action taken.
- To take relevant scientific decisions. This aspect depends on the scientific competence of the official in charge and has to do with decisions concerning animal transportation, euthanasia (if required), necropsy, and data and photography collection.

Data Collection

Scientific data collection requires a detailed, carefully planned protocol implemented by qualified personnel. Given that the level of response and capacities to respond to strandings differ among most countries and situations, there is a tendency to collect data at two levels: basic information pertaining to the stranding and more complex data which may vary as a function of the logistic and technical possibilities of each country.

Examples of data collection forms from the Mediterranean (Basic and Advanced Forms from the Mediterranean Database of Cetacean Strandings -MEDACES) and the USA (Marine Mammal Level A Stranding Data Report) are available in Annex II.

A summary of Basic Information required for each stranding include:

- Details of both the informant and the scientific reporter: name and address (institution)
- Field number
- Number of animals including this one
- Date (dd/mm/yyyy), time of first discovery
- Location: latitude and longitude (to 0.1 minute, if possible), locality, region, country
- Species identification (by qualified personnel)
- Sex of animal (by qualified personnel)
- Total body length
- Weight (if possible)
- Animal condition.
  a) alive
  b) dead
  1) freshly dead
  2) decomposed but organs basically intact
  3) advanced decomposition (organs not recognisable)
  4) mummified or skeletal remains only

- Report marks or external wounds
- Pictures should always be taken, including: Whole body, head, jaws, dorsal fin, tail, genital area, and old scars.

Supplementary on-site information include:
- Weather and tide conditions
- Human/predator activity
- Presence of prey species
- Behaviour
- Samples collected for life history (e.g. teeth, ear plugs, reproductive tracts, stomach contents) and for blood studies, toxicology, microbiology, histopathology, parasites collected.

**Collection and Storage of Samples**

**Labelling**
Great care should be exercised labelling the samples. Two labels, one inside and another outside the container, should accompany each sample.

This is because external labels are easily detached at high humidity or at freezing temperatures. Each label should include the following data:

- Reference no. designating the individual animal.
- Type of tissue.
- Purpose of the sample (histopathology, virology, etc.).

Labels should be written legibly in permanent ink, using adequate terminology and preferably in English.

**Life History Studies**

**Age determination**
Collection: in odontocetes, take 4-5 teeth from the middle of the lower jaw. Choose teeth that appear intact and little curved. If the jaw does not need to be preserved for preparation
of the skeleton, it can be sawed to collect the teeth more easily.

Fixation and storage: Teeth can be frozen at -20°C or kept in 70% ethanol. They should not be kept at room temperature as they may crack hampering age determination.

**Digestive contents**

Collection: The contents of each stomach compartment should be collected separately and kept frozen at -20°C. Alternatively, 70% ethanol can be used to preserve the stomach contents, but formaldehyde solutions should be avoided as they can dissolve small fish bones.

**Genetic studies**

A piece of skin (2 x 2 cm) should be collected and kept frozen (-20°C) or fixed in either 70% ethanol or 20% dimethyl sulfoxide (DMSO) solution saturated with NaCl.

**Reproductive status**

Collection: In females both ovaries must be collected and weighted making the distinction between the left and right ovary. Ovarian scars should also be noted, and to which side they correspond. In males only one testis needs to be collected and weighted.

Fixation and storage: part of the gonads must be fixed in a buffered solution of 10% formaldehyde.

**Skeleton**

It is necessary to know beforehand whether the skeleton is to be kept intact for collection purposes. In this case the necropsy is more complex as the integrity of the bones should be sought. The skull is crucial for the confirmation of species identification and every effort should be made to collect and save it. Particular attention must also be paid to preserve the pelvic bones, as well as the tympanic bullae and hyoid bones.

**Health Studies**

**Toxicology**

Collection: Although 10 g are enough to perform the analyses, large tissue samples (± 250 g) should be collected. For the analyses of persistent organic pollutants (POPs), samples of blubber, dorsal muscle, liver, kidney and brain should be wrapped in aluminum foil and then stored in a plastic bag. A sample comprising the whole depth of the blubber (free of skin and muscle) should be collected at the posterior level of the fin. For heavy-metal analyses, samples of blubber, dorsal muscle, bone (5th rib), liver, kidney and brain should be cut when possible with plastic knives (since contact with any metal should be avoided) and stored in new plastic bags; and if not, the fact must be reported. The liver and kidney should be weighed before any sample is taken.

In lactating females, collect milk samples in glass vials. Foetuses should be surveyed in the same fashion as adults.

Fixation and storage: samples should be preserved at -20°C if analyses are not carried out immediately. Ideally samples should be weighed before freezing, its weight being reported on the label, because of liquid losses associated to freezing.

**Microbiology**

Samples from lesions that are suspected to have an infectious origin must be taken in an
aseptic fashion with a sterile scalpel blade. The surface of the sample must be disinfected in 70 % ethanol. Then the sample (2 x 2 x 2 cm for virology or 6 x 6 x 6 cm for bacteriology, aprox.) should be placed in a suitable container. Commercial kits for the collection and storage of such samples are available.

a) Virology
Collection: Sampling of parenchyma and lesions of potential infectious origin should be taken in an aseptic fashion.

Fixation and storage: samples should be placed as soon as possible at 4°C. If they cannot be transported to a specialised laboratory within 24 h, they should be frozen (ideally at -80°C).

b) Bacteriology
Collection: the collection of liquids (blood, pus, urine, etc.) should be done with a syringe or a sterile Pasteur pipette after disinfection (alcohol, cauterisation) of the organ surface (heart, bladder, etc.). An intestinal loop, with adjacent mesenteric ganglion, must be collected after ligature of its two ends.

Parasitology
Collection: parasites should be collected and fixed in a solution of 70 % ethanol with 5 % glycerine. If such a solution is not available, they can be stored in a 10 % formaldehyde solution. If all individuals are not collected, the whole number should be estimated. When surveying for parasites, special attention should be paid to the ear sinuses, the air passages and pulmonary blood vessels, liver and hepatic ducts, pancreas, the different stomach compartments and the intestine. If the skull is to be kept intact, caution should be exercised when dissecting the ear sinuses to avoid damage to the tympanic bulla. If lesions associated to parasites are detected, fix the ensemble in 10 % formaldehyde.

Fixation and storage: fixed specimens can be stored at room temperature. Fresh tissues or organs for parasite examination should be refrigerated at 4°C. Freeze (-20°C) if they cannot be examined within 24 h.

Histopathology
Collection: samples should be collected to include a zone of juxtaposition of normal tissue and the lesion. Avoid manipulating the sample excessively to avoid damaging its microstructure. For large organs, it is preferable to collect several small samples rather than a large one.

Fixation and storage: The best fixative is a buffered solution of 10 % formaldehyde. A nonbuffered solution can be used instead and has the advantage that can be readily prepared on the field, but this will preclude ulterior immunohistochemical analyses.

Since the penetration of the fixative is slow, it is advisable to:
- make small slices thinner than 1 cm thick
- slice large samples at regular intervals
- inject fixative in hollow organs (bladder, eye, etc.) and lesions (e.g. cysts).

The ratio between the volume of fixative and that of the tissue should be around 10:1 and even 20:1 for brain samples. Since tissues tend to stiffen in formaldehyde, it is advisable using vials with large openings. Do not freeze samples for histopathology either before or after fixation.

Other related studies

Immunohistochemistry
Fix all samples with a buffered solution of 10% formaldehyde. Fixation should be as short as possible. Ideally analyses should be carried out within 24 h.

**Electron Microscopy**

Samples should be collected as fast as possible, cut in small cubes (1 mm³), fixed in glutaraldehyde and stored in glass vials.

**Molecular Biology (PCR)**

Samples for molecular studies (2 x 2 x 2 cm) must be frozen quickly and stored at -20°C.

**Carcass disposal**

One of the more relevant actions from both the media and public health perspective is to develop a protocol for the disposal of stranded cetaceans after death and data collection. The decisions are constrained by the size and condition of the animal, stranding location characteristics and logistic factors.

Whereas a small cetacean, such as a dolphin, is easy to handle and transport, large animals like sperm or baleen whales are difficult to deal with. Likewise, there are differences depending on whether the body is fresh or in advanced state of decomposition or on the geographical characteristics of the coast, e.g. sandy beaches vs. inaccessible, abrupt and steep shorelines. Finally, the support of human resources, both officials and volunteers, and the availability of equipment, such as vehicles, excavators, boats, etc., is also important. For that reason, it is recommended that a brief report containing basic findings and acknowledgement to local support be prepared and displayed, as appropriate, at local facilities (city hall, port police office, etc).

Incineration is the best method to dispose of the carcass of a cetacean. Logistics allowing, large animals should be cut in manageable pieces. If cremation is not possible, the body should be buried in an authorised dump.

Incineration on the beach or disposal at sea should be avoided because of the risks posed to public health and navigation.

**Basic field equipment**

The minimum material necessary to perform a necropsy of a stranded animal would include:

- Latex gloves (not plastic)
- Data sheets
- Waterproof markers
- Measuring equipment
- Knives, scissors, scalpel, string, plastic knives
- Sample containers, vials and labels
- Aluminum foil and new plastic bags and sacs
- Kitchen paper roles
- Scales or dinamometres
- Cooler with ice packs
- Preservatives (70% ethanol, 10% formalin, others)
- First-Aid kit
- Photographic camera

**III. Key References for Protocols and Techniques for Responding to Strandings**
Protocols and Techniques

Prepared by the UNEP/ Mediterranean Action Plan through its Regional Activity Centre for Specially Protected Areas (RAC/SPA), which is synchronously the Mediterranean Sub-regional Coordinating Unit of the Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and Contiguous Atlantic Area (ACCOBAMS). The RAC/SPA is the depositary for the Mediterranean Database of Cetacean Strandings (MEDACES- www.medaces.uv.es/home_eng.htm). This database, whose management and implementation is entrusted to the University of Valencia’s Cavanilles Biodiversity Institute (ICBIBE), has been set-up to co-ordinate all national and regional efforts for riparian countries. This database project was created under the Barcelona Convention and extended to the area covered by ACCOBAMS. It is currently supported by the Spanish Ministry of Environment. Cetacean stranding data are expected to be organized into a spatially referenced database of public access.

This comprehensive manual describes rescue operations, how to organize a response team, and how to deal with the media and the public. It includes basic information on marine mammal biology, life history, and health, and an extensive bibliography. It also provides stranding network participants with practical guidelines for collecting data and specimens. The 2005 edition includes topics such as: recognizing, responding to, and investigating unusual mortality events; new or updated protocols for specimen and data collection (e.g., samples for PCR analysis; basic guidelines for investigating possible noise-related strandings; collecting environmental data and samples; and a detailed protocol for examining marine mammals for signs of human interactions).

The U.S. NOAA Fisheries’ Marine Mammal Health and Stranding Response Program (MMHSRP) is currently developing national protocols that will help standardize the marine mammal stranding and disentanglement network across the US while maintaining regional flexibility. These protocols are proposed to be issued in one consolidated manual, Policies and Best Practices for Marine Mammal Stranding Response, Rehabilitation and Release. Interim documents available from their site (http://www.nmfs.noaa.gov/pr/health/eis.htm) are listed below.

Other

IWC – International Whaling Commission

A Ship Strikes Working Group (SSWG) was established under the Conservation Committee of the International Whaling Commission-IWC. Recognising that ship strikes may be one of the reasons for cetacean strandings, the SSWG recommended that a review of the geographical distribution of stranding networks be undertaken to identify gaps in coverage.

A draft table has been compiled on cetacean stranding networks worldwide. The intention is to obtain as comprehensive a list as possible of known strandings networks and contact persons. The SSWG will then discuss the most appropriate way to gather more information including the spatial and temporal coverage of any networks and the type of information collected when a stranding is reported.

Information Sources for Marine Mammals

Texas A&M University at Galveston

Department of Marine Biology at Texas A&M University at Galveston

Current Advances in Marine Mammal Science - (CAMMS) was developed to help keep researchers informed of current marine mammal publications. CAMMS is a truly searchable database. Users can now import references into a Reference Manager or ProCite database in one step and import references into EndNote or other reference managers from a text file. CAMMS is a cooperative project with the Marine Mammal Research Program (Texas A&M University).

ANNEX I

Extract- APPENDIX IV Recommendations – Trinidad Workshop

Training on Stranding Response in the Wider Caribbean

APPENDIX IV: WORKSHOP RECOMMENDATIONS

I. Immediate Country Commitment
   Commit to prioritize establishment of a stranding network in their country
   Frame marine mammal strandings as indicators of marine ecosystem health—identifying emerging diseases, anthropogenic influences, etc.
   Establish improved relationship with respective Department of Fisheries
   Hold stakeholder meetings to get NGO’s, Fisheries, Agriculture, fishermen, etc. on same page with regards to stranding response

II. Further Training Needs
   Training of frontline responders (e.g., fishermen, park rangers, lifeguards)
     • Do’s and Don’ts of Strandings
     • Species ID basics
     • “Who” to call and “What” information technical response team will need
     • What help the responders can provide (e.g. stabilizing the animal)
     • Participants should work with national Departments of Fisheries to incorporate marine mammal stranding training into pre-existing training for fishermen
   Technical Response Team (i.e., group that goes to the beach to respond to the animal: unique specific training sessions for each island)
     • Beach protocol: incident command, stabilizing live animals, recovering dead animals, etc.
     • Necropsy training
     • Sample collection needs and protocols
     • Combination of lecture and hands-on sessions: theoretical lectures followed by practical hands-on sessions worked well at this meeting and should continue
   Repeat of this workshop on other Eastern Caribbean islands
   Training sessions at other workshops as applicable (e.g. Commonwealth Veterinary Congress meeting in Barbados 2007)
   A second workshop of these participants (in a different location or a virtual meeting) to review progress to date

III. Education programs
   School programs: grade school and advanced
   University/Veterinary students
   Public outreach: posters, television programs/PSA’s

IV. Data collection/standardization
   Creation of a common data form and entry protocol (software program)
Clearinghouse/central database for stranding data and voucher (reference) materials
Identification of advanced analysis capabilities for collected samples (incorporating feedback for the collectors)

V. Further communication: Mailing Listserve/website/FTP site creation
Sharing of files, photos news, etc.
Know “who” to contact for further information, to answer questions, etc.

VI. Further funding needs
Sample analysis
Creation of pooled funds to allow for opportunistic hands-on inter-island exchange of stranding response team members (in case of a major stranding event on one island, personnel from a different island can respond to assist)

VII. Legislative needs
Development and circulation of a template for legislation to protect marine mammals for those countries that do not currently have a specific law

VIII. Stranding equipment kits
Personnel from each island will be identifying stranding response equipment needs, which NOAA Fisheries will provide within the next few months

IX. Overall Benefits of MMS Workshop
New exposure to the world of marine mammal strandings—seeing relevance to other disciplines, importance of data from stranded animals, identifying data that can be collected, hands-on pathology experience
Interdisciplinary, ecosystem-wide research questions and identification of potential collaborators
Fostering international cooperation: networking and commonality of research goals identification of what can be prepared prior to a stranding event

X. Products Resulting from the Workshop
CD-ROM with Power Point presentations by all lecturers
Books, reprints, brochures, and other reference materials as requested by participants
Updated participant list and contact information
Dichotomous key for Caribbean marine mammal species identification
Suggested priority sample collection list
Final Conference Report, including data collected during internal and external examination of necropsied animals
Summary of available resources of workshop participants (e.g., professional expertise, institutional logistics)
## ANNEX II

### MARINE MAMMAL STRANDING REPORT - LEVEL A DATA

<table>
<thead>
<tr>
<th>FIELD ID</th>
<th>NMFS REGIONAL ID</th>
<th>NATIONAL DATABASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMON NAME</td>
<td>GENUS</td>
<td>SPECIES</td>
</tr>
</tbody>
</table>

**EXAMINER**

<table>
<thead>
<tr>
<th>Name</th>
<th>Affiliation</th>
<th>Address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>LOCATION OF INITIAL OBSERVATION</th>
<th>OCCURRENCE DETAILS</th>
<th>CAE</th>
</tr>
</thead>
<tbody>
<tr>
<td>State:</td>
<td>County:</td>
<td></td>
</tr>
<tr>
<td>City:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Body of Water:</td>
<td></td>
<td></td>

</tr>
</tbody>
</table>

**INITIAL OBSERVATION**

<table>
<thead>
<tr>
<th>Date:</th>
<th>Month:</th>
<th>Day:</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Observed:</td>
<td>Beach or Land</td>
<td>Floating</td>
</tr>
</tbody>
</table>

**CONDITION AT INITIAL OBSERVATION (Check One):**

- 1. Alive
- 4. Advanced decomposition
- 2. Fresh dead
- 5. Mummified/Skeletal
- 3. Moderate decomposition
- 6. Unknown

**LEVEL A EXAMINATION**

<table>
<thead>
<tr>
<th>Date:</th>
<th>Month:</th>
<th>Day:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Able to Examine:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CONDITION AT EXAMINATION (Check One):**

- 1. Alive
- 4. Advanced decomposition
- 2. Fresh dead
- 5. Mummified/Skeletal
- 3. Moderate decomposition

**INITIAL LIVE ANIMAL DISPOSITION (Check one or more):**

- 1. Left at Site
- 7. Transferred to Rehabilitation Facility
- 2. Released
- 8. Died during Transport
- 3. Abandoned/Orphaned
- 9. Euthanized during Transport
- 4. Died at Site
- 10. Other: |

</tbody>
</table>

**CONDITION AT EXAMINATION (Check One):**

- 1. Alive
- 4. Advanced decomposition
- 2. Fresh dead
- 5. Mummified/Skeletal
- 3. Moderate decomposition

**CONDITION/DETERMINATION (Check one or more):**

- 1. Sick
- 4. Dead/Healthy
- 2. Injured
- 7. Location Hazardous
- 3. Abandoned/Orphaned
- 8. Unknown/OB/D or Other:
- 4. To animal
- 9. To public
- 5. Inaccessible
- 10. Other: |

**PHOTOS/VIDEOS TAKEN:**

<table>
<thead>
<tr>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
</table>

**PHOTO/VIDEO DISPOSITION:**

**TAG DATA**

<table>
<thead>
<tr>

*NOAA Form 89-966 Rev. (2004)
**PLEASE USE THE BACK SIDE OF THIS FORM FOR ADDITIONAL REMARKS**

---
**BASIC DATA**

**Scientific** (The scientific or administrative authority sending this form)

Surname: 
Name: 
e-mail: 

**Finder** (The Institution notifying the stranding)

Institution: 
Telephone: 
e-mail: 

**Stranding**

Own animal code: 

If mass stranding (*), indicate number of individual: (*) Please fill one form per animal sampled.

Date (dd/mm/yyyy): 
Time (hrs:min) of first discovery: 

Species identification by qualified personnel: 

Condition of animal:

- Alive
- Freshly dead
- Organs not recognizable
- Decomposed but organs basically intact
- Mummified or skeletal remains only

Sex:

- Unknown
- Male
- Female

Pictures

Weight in Kg (e.g., 38.4): 

Female:

- Pregnant
- Pregnant (foetus kept)
- Lactant

(Please, fill one form for the foetus)
Body Measurements

- 1. Total length
- 2. Upper jaw to posterior edge of dorsal fin
- 3. To center of blow hole
- 4. To center of eye
- 5. To anterior melon
- 6. To anterior flipper edge
- 7. Fin height
- 8. Trailing edge flipper
- 9. Max. width flipper
- 10. Leading edge flipper
- 11. Anterior tip of lower jaw to center of genital slit
- 12. To center of anal
- 13. Fluke width
- 14. Mid-fluke length

Parts missing:

---

Basic Data
# Geographic Location

**Site of stranding:**

- **Site of stranding (name of the beach, harbour, etc.):**
- **Locality:**
- **Province/State/County:**
- **Country:**

**Coordinates:**

- **Latitude:** "\_\_\_ \_\_\_\_\_ N"
- **Longitude:** "\_\_\_ \_\_\_\_\_ W"

**Datum:**

- **Unknown**
- **WGS 84**
- **European Datum (ED)**
- **Others:**

Datum is specified in the key of a map or chart.

**Origin of coordinates:**

- **Unknown**
- **GPS**
- **Official map**
- **Nautical chart**
- **Others:**
